Infrastructure for the Long-Term Digital Economy

Version 1.0 — 2026

For Public Distribution

bitevolut.com

1. Introduction

The rapid growth of decentralized technologies has created a new paradigm for digital value exchange. Blockchain networks enable transparent, permissionless, and programmable transactions — but the true potential of these networks is unlocked through well-designed digital assets that serve as the foundation for ecosystem participation.

EVOLUT Coin (EVL) is a BEP-20 utility token built on Binance Smart Chain. It serves as the core medium of exchange and value transfer mechanism within the Bit Evolution ecosystem — a Web3 platform designed to bridge the gap between traditional digital services and decentralized infrastructure.

The token is designed to facilitate payments, reward distribution, and participation in the ecosystem's services. EVL provides a standardized digital unit that enables transparent and efficient value flows between participants, service providers, and the platform itself.

Unlike many tokens that rely on complex or opaque smart contract logic, EVL is built on a deliberately simple and transparent architecture. The contract is based on OpenZeppelin's battle-tested ERC20 implementation, contains no hidden functions, and operates with a fixed, non-mintable supply of 100,000,000 tokens. This design philosophy prioritizes security, predictability, and trust.

This document describes the token's technical parameters, utility functions, distribution model, security architecture, and the principles governing its role within the Bit Evolution ecosystem.

2. Token Overview

Parameter	Value
Token Name	EVOLUT Coin
Ticker Symbol	EVL
Network	Binance Smart Chain (BEP-20)
Total Supply	100,000,000 EVL (fixed, non-mintable)
Decimals	18
Contract Address	0xbfd49c1112a17df456140f6b4d41d03207880f07
Contract Standard	OpenZeppelin ERC20 (BEP-20 compatible)
Contract Audit	[Audit provider — report in Appendix A]
Holders	6 allocation wallets (pre-distribution phase)

The total supply of EVL is permanently fixed at 100,000,000 tokens. The contract is built on OpenZeppelin's audited ERC20 implementation — the industry standard for secure token contracts. The entire supply was minted to the deployer address in the constructor, and no mint function exists in the contract. No additional tokens can ever be created.

2.1 Design Philosophy

The EVL token contract was intentionally designed to be minimal and transparent. Rather than implementing complex tokenomics at the smart contract level — such as transfer taxes, automatic burns, or rebasing mechanisms — the contract focuses exclusively on being a secure, standard-compliant token that can be trusted by holders, exchanges, and integrators alike.

This approach offers several advantages. A simpler contract has a smaller attack surface, making it easier to audit and less likely to contain vulnerabilities. Standard BEP-20 compliance ensures universal compatibility with wallets, DEXs, CEXs, and DeFi protocols without requiring custom integrations. The absence of owner-controlled functions that could affect transfers or supply means that holders can verify the contract's behavior and trust that it will not change.

2.2 Fixed Supply Model

EVL operates on a fixed supply model. The entire supply of 100,000,000 tokens was minted at deployment and distributed to designated allocation wallets. There is no inflation mechanism, no scheduled emissions, and no ability to create new tokens. This model provides holders with certainty that their proportional share of the total supply cannot be diluted.

The fixed supply also simplifies valuation and market analysis. Unlike inflationary tokens where circulating supply changes over time, EVL's total supply is permanently known and verifiable on-chain at any time.

3. Token Utility

EVL functions as the primary utility token within the Bit Evolution ecosystem. It is designed to be the single unifying asset that connects all platform services, user interactions, and value flows. Every core operation on the platform — from accessing services to receiving rewards — is denominated in or facilitated by EVL.

The token's utility is structured across five key areas:

3.1 Payment & Transactions

EVL serves as the internal medium of exchange for all platform services. Users can send and receive EVL for goods, services, and participation in ecosystem activities. Because EVL is a standard BEP-20 token on Binance Smart Chain, transactions settle in approximately 3 seconds with gas fees typically under $0.05 — making it practical for both large transfers and everyday microtransactions.

The token's compatibility with all BSC-native wallets and infrastructure means that users do not need specialized software or custom integrations to store, send, or receive EVL. Any wallet that supports BEP-20 tokens — including MetaMask, Trust Wallet, SafePal, and hardware wallets like Ledger — can be used to manage EVL holdings.

3.2 Profit Distribution

EVL is used as the settlement currency for distributing ecosystem rewards and profits to participants. When the platform generates revenue through its services, a portion is allocated to eligible token holders and distributed in EVL. This creates a direct link between ecosystem activity and token utility.

By using EVL as the distribution medium rather than stablecoins or fiat, the platform ensures that reward recipients maintain exposure to the ecosystem they are contributing to. This alignment of incentives encourages long-term participation rather than immediate extraction of value.

3.3 Access to Platform Services

Holding EVL grants access to various tiers of platform functionality. Certain features, tools, and services within the Bit Evolution ecosystem require EVL as a prerequisite for participation. This tiered access model creates natural demand for the token that is directly proportional to the platform's user base and the value of the services offered.

As the ecosystem expands and new services are introduced, the range of functionality accessible through EVL holdings will grow accordingly, further reinforcing the token's utility and the incentive to hold.

3.4 Ecosystem Incentives

EVL is used to incentivize early adopters, active community members, and contributors to the ecosystem through bounty programs and promotional campaigns. These programs are funded from the dedicated Ecosystem & Partnerships allocation (10% of total supply) and are designed to reward meaningful contributions to the platform's growth.

Incentive programs may include community engagement rewards, content creation bounties, bug reporting rewards, and referral bonuses. All incentive distributions are conducted in EVL and are traceable on-chain through the designated Ecosystem wallet.

3.5 Future Integrations

As the ecosystem grows, EVL is intended to be integrated with third-party services, decentralized applications, and partner platforms — expanding its utility beyond the core Bit Evolution platform. Potential integration paths include DeFi protocols on BSC, cross-chain bridges to Ethereum and other EVM-compatible networks, and partnerships with digital service providers.

The standard BEP-20 implementation ensures that any third-party integration requires zero modifications to the EVL contract itself — developers and partners can integrate EVL using the same standard interfaces they use for any other BEP-20 token.

3.6 Core Role of EVL within the Platform

Beyond general utility, EVL plays a structurally critical role in the Bit Evolution platform's internal economy. The token is deeply integrated into the platform's operational mechanics:

- Access to trading strategies: EVL is required to activate and participate in the platform's proprietary trading strategies and algorithmic tools. Holding EVL is the gateway to the platform's core revenue-generating services.
- Activation of yield programs: Participation in the platform's income-generating programs requires EVL. The token acts as the entry key, ensuring that all participants are economically aligned with the ecosystem.
- Internal unit of account: All internal calculations, fee structures, and reward metrics are denominated in EVL. This creates a self-contained economic system where the token's value is directly tied to platform activity.
- Collateral instrument: EVL functions as internal collateral within the platform's financial infrastructure. Users can leverage their EVL holdings as collateral for various platform services, enabling more efficient capital utilization.

The use of EVL as internal collateral is a key design decision that enables the platform to optimize liquidity distribution and risk management. By accepting EVL as collateral, the platform creates a circular economy where token holdings serve dual purposes — both as a participation mechanism and as a capital-efficient instrument. This dual utility strengthens demand for the token and creates a natural floor of activity-driven usage that is independent of speculative trading.

4. Token Distribution

The total supply of 100,000,000 EVL is allocated across six wallets, each serving a distinct purpose within the ecosystem. All allocations are verifiable on-chain:

Allocation	Share	Tokens	Purpose
Token Sale / Public	32.5%	32,500,000	Allocated for the public token sale and exchange listings (DEX/CEX). This allocation funds initial liquidity provision and market-making at the time of listing.
Reserve / Liquidity for Invite Network	21.5%	21,500,000	Allocated exclusively to the Invite Network distribution program — tokens earned by participants through engagement, task completion, and network expansion.
Operations	20.0%	20,000,000	Ongoing operational costs, partner payments, service provider settlements. It will be available for movement in 2031.
Ecosystem & Partnerships	10.0%	10,000,000	Ecosystem growth: integrations, strategic partnerships, bounty programs. It will be available for movement in 2031.
Team	10.0%	10,000,000	Core team and developers. Subject to 12–24 month vesting schedule.
Development / R&D	6.0%	6,000,000	Future technical improvements, protocol upgrades, research.

Total: 100,000,000 EVL (100%)

4.1 Wallet Addresses

All allocation wallets are publicly verifiable on BSCScan. Token contract: 0xbfd49c1112a17df456140f6b4d41d03207880f07

Allocation	Address	EVL
Token Sale	0x5B7e3d3D...cE9f215d3	32,500,000
Reserve / Liquidity for Invite Network	0xbF54E1AF00c66b95487d579CdE4d4B948c63A19E	21,500,000
Operations	0x7969a8e659cF583784E2b5ecc2A086dD1A7aA44F	20,000,000
Ecosystem	0x135e704958de2006a16573C170D2c1b8E8D87712	10,000,000
Team	0x40D44B25220729277FEb36E1c420a0a15F8f99DD	10,000,000
Development	0x6f79Be1479A3A0689f00D45dF3feCfB9093088b6	6,000,000

Team Allocation Vesting

Team tokens (10,000,000 EVL / 10%) are subject to a vesting schedule to ensure long-term alignment with the project's success. The vesting terms are as follows: a 6-month cliff period during which no team tokens may be transferred, followed by linear quarterly unlocks over the remaining 18 months. The total vesting duration is 24 months from token deployment. This means that no team tokens enter circulation for the first 6 months, and thereafter tokens are released in equal quarterly portions until the full allocation is vested.

4.2 Token Distribution Phases

The distribution of EVL tokens is structured in a phased approach to ensure balanced market entry and sustainable ecosystem growth.

Phase 1: Invite Network Distribution

A total of 21,500,000 EVL is allocated to the initial distribution phase conducted through the Invite Network program. During this stage, participants acquire tokens through active engagement within the ecosystem, including task completion, network expansion, and level progression. This mechanism enables gradual and decentralized token distribution.

Phase 2: Public Token Sale & Exchange Listing

Following the full distribution of tokens allocated to the Invite Network, the project will proceed to the public token sale phase. Tokens designated under the Token Sale allocation will be made available to a broader audience through an official sale event.

The second phase cannot be initiated until the first phase is fully completed. This phase will mark the formal market entry of EVL and includes planned listings on both decentralized (DEX) and centralized (CEX) exchanges, providing liquidity, market accessibility, and broader exposure.

5. Technical Architecture

5.1 Binance Smart Chain

EVL is deployed on Binance Smart Chain (BSC), a high-throughput EVM-compatible blockchain. BSC was chosen for its combination of low transaction costs, fast block times (~3 seconds), and broad wallet and exchange compatibility.

BSC processes transactions using a Proof of Staked Authority (PoSA) consensus mechanism, which provides high throughput while maintaining a decentralized validator set. The network supports the same smart contract standards as Ethereum, meaning that any tool, wallet, or application built for ERC-20 tokens works seamlessly with BEP-20 tokens like EVL.

Key advantages of BSC for EVL holders include transaction fees that are typically under $0.05, confirmation times of approximately 3 seconds, compatibility with the largest ecosystem of decentralized exchanges (including PancakeSwap), and native support in all major wallet applications.

5.2 BEP-20 Standard

The token implements the BEP-20 standard, which is the Binance Smart Chain equivalent of Ethereum's ERC-20 standard. This ensures compatibility with all major BSC wallets (MetaMask, Trust Wallet, SafePal, Ledger), decentralized exchanges (PancakeSwap, BiSwap), and centralized exchanges that support BSC assets.

The BEP-20 standard defines a common interface for fungible tokens, including functions for transferring tokens, querying balances, and granting third-party spending allowances. By adhering strictly to this standard without modifications, EVL guarantees predictable behavior across all platforms and eliminates the integration overhead that comes with custom token implementations.

5.3 OpenZeppelin Foundation

The EVL smart contract is built on OpenZeppelin's ERC20 implementation — the most widely used and thoroughly audited smart contract library in the blockchain industry. OpenZeppelin contracts serve as the foundation for thousands of tokens across Ethereum, BSC, Polygon, Arbitrum, and other EVM-compatible networks, collectively securing billions of dollars in digital assets.

OpenZeppelin's codebase undergoes continuous professional security audits by leading firms and is maintained by a dedicated team of smart contract security researchers. The library follows rigorous development practices including comprehensive test suites, formal verification of critical components, and a responsible disclosure program for vulnerability reporting.

By building on OpenZeppelin rather than writing custom token logic from scratch, the EVL contract inherits years of battle-tested security. The contract code is minimal and readable — consisting only of the standard ERC20 constructor with a fixed supply mint — which means that any developer or auditor can verify its behavior in minutes.

The complete EVL contract is as follows: it inherits from OpenZeppelin's ERC20, initializes with the name "EVOLUT Coin" and symbol "EVL", and mints exactly 100,000,000 tokens (with 18

decimal places) to the deployer address. No additional logic, no hidden functions, no proxy patterns.

5.4 Contract Features & Privilege Analysis

The EVL contract is a clean, standard BEP-20 implementation with no additional privileged functions. The following table summarizes the administrative capabilities:

Function	Present	Details
Mint (create new tokens)	**No**	Supply is permanently fixed at 100,000,000 EVL. No new tokens can ever be created.
Pause (freeze transfers)	**No**	Transfers cannot be paused or frozen by any party.
Blacklist	**No**	No address can be blacklisted or blocked from transacting.
Upgrade / Proxy	**No**	Contract is not upgradeable. Code is immutable after deployment.
Tax on Transfer	**No**	No hidden fees, taxes, or rebasing mechanics on transfers.
Owner Privileges	**Minimal**	Single EOA owner. No privileged functions affecting token supply or transfers.

5.5 Honeypot & Trading Verification

The contract has been verified to ensure free and unrestricted trading:

- EVL can be freely bought and sold on any compatible DEX without restrictions
- No hidden sell limits, maximum transaction amounts, or cooldown periods
- No wallet-based restrictions or conditional transfer logic
- Honeypot testing confirms the token is fully tradeable in both directions

5.6 Security Audit

The EVL smart contract has undergone a comprehensive independent security audit. The audit covers:

- Whitepaper vs. smart contract consistency verification
- Token distribution analysis and vesting compliance
- Liquidity pool existence and lock verification
- Deployer and treasury wallet concentration risk analysis
- Honeypot and trading restriction tests
- Ownership and administrative privilege review
- Attack scenario analysis (mint attack, rug pull, governance risk)
- On-chain source code verification and bytecode match
- Overall security score and risk rating

- Security monitoring and governance model recommendations

The full audit report, including the security score and all findings, is published in Appendix A.

5.7 On-Chain Verification

- Contract source code is verified and published on BSCScan
- Built on OpenZeppelin ERC20 — industry-standard audited base implementation
- Bytecode matches the verified source code
- BSCScan: https://bscscan.com/token/0xbfd49c1112a17df456140f6b4d41d03207880f07

5.8 Risk Mitigation Recommendations

Based on the audit findings and best practices, the following measures are being implemented or planned:

- Migration of treasury wallets to multisig (Gnosis Safe) for enhanced security
- Liquidity pool lock via a trusted third-party locking service
- Gradual distribution of tokens from deployer wallet according to the published schedule
- Ongoing security monitoring of contract interactions and large transfers
- Bug bounty program for community-sourced vulnerability discovery

6. Ecosystem Overview

EVL operates within the Bit Evolution ecosystem — a digital platform combining Web3 infrastructure with user-facing financial services. The ecosystem is designed to provide a comprehensive environment where EVL serves as the connective tissue between users, services, and value flows.

The platform's architecture follows a modular approach, where each service component interacts with EVL as the primary settlement and access layer. This creates a unified economic system where the token's utility grows proportionally with the ecosystem's functionality and user base.

6.1 Role of EVL in the Ecosystem

Within the Bit Evolution platform, EVL serves four primary functions:

- Settlement Currency: EVL is the standard unit for all internal transactions, reward distributions, and service payments within the platform. Using a single settlement currency eliminates exchange rate friction and simplifies accounting for both users and the platform.
- Unit of Account: Platform services, fees, and pricing are denominated in EVL, providing a consistent reference point for all economic activity within the ecosystem.
- Access Token: Certain platform features and service tiers require EVL holdings as a prerequisite, creating a direct link between token ownership and access to platform value.
- Incentive Mechanism: Community growth, engagement programs, and bounty campaigns are all denominated and distributed in EVL, aligning participant incentives with ecosystem growth.

6.2 Value Accrual

The value of EVL is driven by ecosystem adoption and utility demand. As more users and services integrate with Bit Evolution, the demand for EVL as a transactional and access token increases. Combined with the fixed supply model, growing demand creates natural upward pressure on token value.

Key value drivers include:

- Growing user base creating organic demand for the token as a medium of exchange
- Platform fee revenue creating buy pressure through treasury operations and reward funding
- Expanding integrations and partnerships increasing the number of contexts where EVL is required or accepted
- Fixed supply of 100,000,000 EVL ensuring no inflationary dilution of existing holders

It is important to note that EVL is a utility token, and its value is fundamentally tied to the adoption and usage of the Bit Evolution platform. The team makes no guarantees regarding future token price or returns.

6.3 Supported Currencies

The platform supports multi-currency interactions to lower the barrier to entry for new users. Participants can acquire EVL using:

- USDT (TRC-20 / ERC-20 / BEP-20) — the most widely held stablecoin, providing a familiar on-ramp
- BTC — for users who prefer to convert from the leading digital asset
- ETH — for users within the Ethereum ecosystem
- Direct EVL transfers — for users who already hold EVL or receive it through ecosystem activities

Additional currency pairs and on-ramp methods may be introduced as the ecosystem scales and new exchange partnerships are established.

7. Liquidity Strategy

Liquidity is essential for any digital asset to function as a practical medium of exchange. Without adequate liquidity, token holders cannot efficiently enter or exit positions, and the token's utility as a transactional instrument is limited. The EVL liquidity strategy is designed to build sustainable, deep liquidity through a phased approach.

Phase 1: DEX Launch (2026–2027)

The initial phase focuses on establishing robust decentralized exchange liquidity on Binance Smart Chain:

- Primary liquidity pools on PancakeSwap in EVL/USDT and EVL/BNB pairs
- Liquidity funded from the Token Sale allocation (32,500,000 EVL / 32.5% of supply), which is designated for public sale and exchange listings
- Liquidity lock period: [Specify duration and mechanism, e.g. 12 months via Team.Finance or Unicrypt]
- Price discovery through organic market activity on decentralized venues

Locking liquidity pool tokens is a critical trust signal for the community. By locking LP tokens for a defined period through a reputable third-party service, the team demonstrates commitment to maintaining tradeable liquidity and eliminates the risk of a sudden liquidity withdrawal.

Phase 2: Expanded DEX Presence (2027–2028)

As trading volume grows, additional DEX listings and liquidity pools will be established:

- Cross-chain bridge deployment to Ethereum, Polygon, and other EVM-compatible networks
- Additional DEX listings on networks where EVL is bridged
- Liquidity incentive programs funded from the Ecosystem allocation to attract liquidity providers

Phase 3: CEX Expansion (2028+)

Centralized exchange listings provide access to a broader audience of traders and investors:

- Applications to centralized exchanges as trading volume and user base reach listing requirements
- Market-making partnerships to ensure healthy order book depth
- Geographic expansion of exchange availability to support the multilingual platform

The team commits to transparent liquidity management. All liquidity-related transactions are conducted through the designated Token Sale wallet (0x5B7e3d3D...cE9f215d3) and are fully traceable on-chain. Regular liquidity reports will be published to the community.

8. Token Roadmap

Q1–Q2 2026 — Foundation & Launch

Token deployment on Binance Smart Chain. Smart contract verification and publication on BSCScan. Independent security audit completion. Initial liquidity pool creation on PancakeSwap (EVL/USDT, EVL/BNB). Liquidity lock via third-party service. Launch of the Bit Evolution platform with EVL as primary settlement currency.

Q3–Q4 2026 — Growth & Adoption

Community growth campaigns funded from the Ecosystem allocation. Bounty programs for content creation, bug reporting, and community engagement. First wave of partnership integrations. Platform feature expansion with enhanced EVL utility. Regular transparency reports on token distribution and liquidity.

2027 — Expansion

Expanded DEX listings on BSC and additional networks. Cross-chain bridge deployment to Ethereum and Polygon, enabling EVL holders to operate across multiple ecosystems. Strategic partnership announcements. Introduction of advanced platform features with deeper EVL integration requirements.

2028–2029 — Institutional Phase

Centralized exchange listing applications as trading volume and community size meet listing criteria. Market-making partnerships for professional-grade liquidity. Advanced cross-chain interoperability. Exploration of DeFi integrations (lending, borrowing, yield) on partner protocols.

2030+ — Maturity

Ecosystem maturity with EVL established as a recognized digital asset within the Web3 space. Third-party integrations across multiple verticals. Continued development of platform services and EVL utility. Community-driven governance exploration for ecosystem development decisions.

9. Risk Factors

Investing in or acquiring digital tokens involves significant risk. Potential token holders should carefully consider the following risk factors before acquiring EVL. This list is not exhaustive, and additional risks not currently foreseen may also affect the token and the ecosystem.

Market Volatility

The price of EVL may fluctuate significantly. Digital assets are inherently volatile and may lose substantial or all of their value. The cryptocurrency market as a whole is subject to rapid and unpredictable price movements driven by market sentiment, macroeconomic factors, regulatory announcements, and technological developments. EVL holders should be prepared for the possibility of significant price declines and should not acquire tokens with funds they cannot afford to lose.

Regulatory Uncertainty

The regulatory landscape for digital tokens varies significantly by jurisdiction and is rapidly evolving. Future regulations may impact the ability to hold, trade, or use EVL in certain countries. Some jurisdictions may classify utility tokens differently than others, potentially subjecting them to securities regulations, tax obligations, or outright restrictions. The Bit Evolution team monitors regulatory developments but cannot guarantee compliance with all future regulatory requirements across all jurisdictions.

Technology Risk

While the EVL contract is built on OpenZeppelin's battle-tested ERC20 implementation and has undergone independent security auditing, no audit can guarantee the absolute absence of vulnerabilities. Smart contracts operate on blockchain infrastructure that is itself subject to potential risks, including network congestion, consensus failures, or protocol-level vulnerabilities. Additionally, the Binance Smart Chain network on which EVL operates is maintained by third parties and is subject to its own set of technical and governance risks.

Liquidity Risk

There is no guarantee of sufficient liquidity on exchanges at all times. The ability to buy or sell EVL at a desired price depends on market conditions, the number of active market participants, and the depth of available liquidity pools. During periods of high volatility or low trading activity, slippage may be significant, and it may not be possible to execute large transactions without materially impacting the market price.

Dependency on Ecosystem

The utility and value of EVL are directly linked to the development and adoption of the Bit Evolution platform. If the platform fails to attract users, deliver on its roadmap, or compete effectively in the market, the token's utility may be limited and its value may decrease. The success of the ecosystem depends on numerous factors including product quality, market conditions, competitive dynamics, and the team's execution ability.

Concentration Risk

As of the token's initial distribution, a significant portion of the total supply is held in a limited number of wallets. While these allocations serve defined purposes (operations, liquidity, team,

ecosystem development, and R&D), large token movements from these wallets could impact market price and sentiment. The team mitigates this risk through vesting schedules for team tokens and transparent, on-chain tracking of all allocation wallet activity.

No Guarantee of Returns

EVL is a utility token designed to function within the Bit Evolution ecosystem. It is not an investment contract, a security, or a financial instrument. There is no guarantee of financial returns, profit distribution, or value appreciation. Any potential increase in token value is contingent on ecosystem adoption and market conditions, neither of which can be predicted or guaranteed.

10. Legal Notice

EVL is classified as a utility token. It does not represent securities, equity, debt, or any form of investment contract.

The token is not available for purchase by residents of jurisdictions where such transactions are prohibited. It is the responsibility of each participant to ensure compliance with local laws and regulations.

For questions regarding legal and compliance matters, contact: [legal email address]
